DEAR CUSTOMERS

The PAROTEC company, thanks to its stable position on the market, is one of the leading and better recognised manufacturers of roofing underlays and roofing accessories.

Thanks to the use of advanced technologies, Parotec products offer excellent technical parameters. The company's absolute priority is the highest quality of offered products, many of which have been internationally certified.

Our leading line of Parotec high diffusion breathable membranes is accompanied by other roof underlays, vapour barriers and diffusive films. Traditionally, we offer a rich lineup of roof accessories, such as: ridge rolls, ridge vents, chimney flashing tapes, metal sheet flashings, roof valleys, tile clips, elements of roof walkways, and snow protection. The production plant of Parotec is located near Poznan and specialises in production of a wide range of roofing accessories and roof valleys.

By choosing to work with us, you gain very high quality products at an attractive price, convenience, availability, as well as the satisfaction from a pleasant cooperation. We hope that our website www.parotec.com.pl will prove to be a useful tool, helping you all the way through.

Best regards
The board members and employees of
Parotec sp. z o.o.

PRODUCTS OF HIGH QUALITY

The quality of our products is our priority. We guarantee that the received product will meet all your demands.

HIGH STOCK VOLUME

Our high stock volume guarantees that your order will be carried out efficiently and with no delays.

PROFESSIONAL CONSULTANTS

We offer an experienced technical support. Our consultants will give you complete information about the products you are looking for.

24h TERMS OF DELIVERY

The time of delivery is crucial to the success of your investment. Our products will be delivered in **3-5 working days**.

The highest quality of the products is the best guarantee of your investments success

Effective hydroisolation

BECAUSE OF CONSTANT CHANGES IN THERMAL INSULATION TECHNOLOGY OVER THE YEARS, IT BECAME NECESSARY TO TAKE SPECIAL CARE OF PROPER VENTILATION IN THE ROOF CONSTRUCTION. MOSTLY IT IS BEING DONE BY HIGH DIFFUSION MEMBRANES AS THE PRE-COVERING AND LINEUP OF VAPOUR BARRIER FOILS TO SECURE THE INSULATION MATERIAL (OFTEN MINERAL WOOL) AGAINST MOISTURE COMING FROM INSIDE OF THE BUILDING.

Roofing underlayment is a water-resistant or waterproof barrier that is installed directly onto your roof rafters. It is applied under all other roofing materials as an added layer of protection from severe weather and moisture.

The roofing membrane system is easy and fast to mount. Membranes, unlike the low diffusion roof foils, can be installed directly on the insulation layer, without the need of building a ventilation gap between them. It shortens the time of mounting and increases the efficiency and life span of the thermal insulation.

Vapour barriers, contrary to membranes and roof foils, have a very high vapour penetration resistance factor, thus building a barrier against the excessive direct penetration of vapour into the structure of the insulation, which on the other hand can lead to the reduction of the effectivity or complete malfunction of the insulation. Vapour barriers covered with a layer of aluminium can serve as an additional insulation by reflecting the IR-rays which transfer heat.

Production of membranes

Our roofing membranes are made with three-layer technology and consist of two outer layers of polypropylene non-woven fibre and an internal functional film, which is responsible for water resistance and vapour permeability of the membrane. All layers are connected during the production process with micro point thermo-lamination which guarantees a high tensile resistance of the membrane. Depending on the type of the membrane, the outer non-woven fibre has a different density. Some products as Parotec Gamma Strong has additional layer of plastic mesh, which increases the durability of the membrane.

CRUCIAL PICTOGRAMS

surface density

SD - value

water tightness

Terms of glossary

• SD

sd-value or "vapour diffusion thickness" expresses the diffusion resistance of a layer in a form which is easily understood and applied. The lower the value the higher the vapour diffusion through the surface of the product. High diffusion membranes are products with an SD-value lower than 0.1m.

• Surface density

defines the substance of the product and indirectly shows the durability of the product against mechanically caused damage. The surface density is strictly related to its use.

• UV-resistance

Membranes and foils, as any other plastic material, have a limited endurance to sunlight, which in this case varies from 60 to 90 days.

• Vapour barrier

is a group of low vapour permeability foils, used for securing mineral wool against moisture.

• Wind barrier

a type of high diffusion membrane used for securing the insulation (mineral wool) of a wall against cooling by the outside air. The product is not meant to be used on sloped pitched roofs as the pre-covering.

• Thermo-insulation screen

insulating material coated with aluminium that is used to reflect infrared heat waves.

Parotec breathable membranes for pre-covering of pitched roofs

We offer a variety of different breathable types to fit the needs of our customers. Our three layer membranes start with Parotec Alfa 110g/m² standard membrane, Parotec Beta 130g/m² with increased endurance, Parotec Gamma 160g/m² and Parotec Gamma Strong 165g/m² with reinforced grid for even better durability. All of them are topped by Parotec Kappa, our 220g/m² four-layer membrane. **All are backed by a 15-year guarantee.**

Sealing system

To ensure full tightness of the initial covering layer it is recommended to use the dedicated tapes of Parotec for joining, repairing and sealing the roofing membranes.

Tensile resistance

The structure of the membrane, by using the micro welding method for connecting the individual material layers, ensures high resistance to tearing and point damage during the mounting.

Vapour permeability

Low indicator of water vapour resistance ($S_d \sim 0.03$) Parotec membranes allow quick drainage of steam which reduces the risk of moisture in the roof's thermal insulation.

Four-layer technology

The membranes like Parotec Kappa produced in the four-layer technology are composed of two outer layers and special reinforcing grid that are protecting the internal function film which is responsible for vapour permeability and watertightness of the membrane.

Surface density guarantee

The maximal tolerance of density is barely 3% and is the lowest such indicator among high diffusional products that are available on the market.

PAROTEC Alfa

It is a light weight roof membrane made out of two layers of UV-stable polypropylene fibre and also a UV-stable function film. The modern production technology of thermal lamination ensures the high quality of the product. The membrane typifies with a high vapour diffusion, water tightness and tensile strength. The PAROTEC Alfa membranes are meant for mounting directly on the rafters, as an additional means of protecting the roof construction and thermal insulation against the impact of moisture, dust, snow and wind. The product can be customised with a personal logo.

PAROTEC Beta

A roof membrane made out of two layers of UV-stable polypropylene fibre and also a UV-stable, function film. Recommended for investors who use construction materials with elevated technical parameters. The modern production technology of thermal lamination ensures the high quality of the product. The membrane typifies with a high vapour diffusion, water tightness and tensile strength. The PAROTEC Beta membranes are meant for mounting directly on the rafters, as an additional means of protecting the roof construction and thermal insulation against the impact of moisture, dust, snow and wind. The product could be customized with personal logo.

PAROTEC gamma

A roof membrane made out of two layers of UV-stable polypropylene fibre and also a UV-stable, function film. Recommended for investors that prefer solid materials of highest class. The modern production technology of thermal lamination ensures the high quality of the product. The membrane typifies with a high vapour diffusion, water tightness and tensile strength. The PAROTEC gamma membranes are meant for mounting directly on the rafters, as an additional means of protecting the roof construction and thermal insulation against the impact of moisture, dust, snow and wind. The product could be customized with personal logo.

PAROTEC gamma strong

Extra strong membrane with reinforcing grid

It is a reinforced version of the PAROTEC Gamma membrane. With the use of reinforcing grid, the product's resistance to stretching and ripping is increased with only a slight change in weight. The PAROTEC Gamma Strong membrane has high water vapour permeability and water-tightness properties and meets the highest standards in terms of quality and resistance. The PAROTEC Gamma Strong membrane should be mounted directly on rafters or on fully boarded roofs. The product can be customised with a personal logo.

PAROTEC kappa

The highest surface density available in the offer!

It is a three-layer, approximately 220 g/m² roof membrane with excellent mechanical strength, high vapour permeability and waterproofness. PAROTEC Kappa meets the highest quality and strength requirements so it is designed for the most demanding customers. It can be installed directly on rafters and thermal insulation or on fully supported roofs. The high-quality materials used to manufacture Parotec Kappa 220 allows this membrane to be exposed to sunlight for up to 6 months! The product can be customised with a personal logo.

PAROTEC PLUS

new membrane line with
double adhesive tape!

Fast and accurate assembly

Parotec membranes with the "plus" line, are equipped with special adhesive strips that facilitate and accelerate assembly work on the roof. Only a properly bonded membrane is an effective waterproofing barrier. In addition, the tight connection of the membrane strips prevents the thermal insulation layer from whiffing, increasing its efficiency. Strips with acrylic adhesive on the inner and outer side of the non-woven fabric should be glued to each other, which guarantees strong bonding on the overlap. The temperature of connecting the belts with each other is 5 °C - 25 °C. Do not glue at too low or too high temperatures and make the adhesive layer dirty. The protective film on the adhesive strips should be removed when gluing.

Comes also with
integral adhesive tape

PLUS

NEW!

PAROTEC Metallo

SPECIALISED MEMBRANE FOR standing seam roof panel

It is a flexible, diffusion-open structural dividing layer. It can be used on all pitched roofs with metal, flat cover and metal facades. It has a carrier foil with an 8 mm high, openwork, profiled structure made of entangled polyamide fibres. Ensures permanent ventilation of the underside of the metal cover. Due to the carrier foil, open for steam diffusion, residual moisture from the roof structure and thermal insulation migrates outwards. Mutes the sounds of rain and hail to 8 dB. Due to the high density of the profile structure, it guarantees that the tinware sections can slide without inhibiting rubbing at temperature fluctuations.

SURFACE DENSITY	DIMENSIONN	UV-RESISTANCE	SD-VALUE	GRID HEIGHT	WATER TIGHTNESS	ROLLS PER PALLET
 450 g / m ²	 1.5x25 m = 37.5 m ²	 4 months	 < 0.02 m	 8 mm	 W1	 8 rolls

PRODUCT CODE

standard 10-085

PAROTEC Matt (without membrane)

Structured mat in the version without a carrier film. It can be used on all pitched roofs with metal, flat cover and metal facades. It has a high 8 mm openwork profiled structure made of entangled polyamide fibres. Ensures permanent ventilation of the underside of the metal cover. Mutes the sounds of rain and hail to 8 dB. Due to the high density of the profile structure, it guarantees that the tinware sections can slide without inhibiting rubbing at temperature fluctuations.

SURFACE DENSITY	DIMENSIONN	GRID HEIGHT	UV-RESISTANCE	ROLLS PER PALLET
 300 g / m ²	 1.4x25 m = 35 m ²	 8 mm	 4 months	 8 rolls

PRODUCT CODE

standard 10-086

Vapour barrier foils

Properties

Mounted inside the building before the mineral wool layer. The foil should be attached to a steel frame with the double-sided tape Steltec. During the installation, ensure a tight connection between each two strips of the foil, using dedicated tapes like Izotec or Alutec. The edges of the foil need to be securely attached to the wall with butyl tape Butyltec. Installation of thermo-insulation screens is similar to vapour barrier foil, with the difference that the space between the layers of screen, wool and wallboard should be at least 2 cm.

Grid reinforcement

Vapour barrier film Parotec alu has additional support for tearing, through an embedded polypropylene mesh between the foil layers.

Surface density guarantee

like among all the other membranes, the Parotec foils have maximum density tolerance of 10%, which lets them stand out from the rest of the products that are available on the market.

Vapour barrier

All types of vapour barrier foils are characterised by excellent water resistance and high water vapour resistance that is blocking vapour passage excess harmful to mineral wool.

Aluminium layer

found in some models of foils, increases the efficiency of conventional insulation. Similar to thermal-insulation screens, it reflects infrared rays, which in effect reduces heat loss from the attic.

■ PRODUCT CODE 12-045(alu 90), 12-046(alu 110), 12-047(alu 150)

PAROTEC Alu 90/110/150

A 4-layer vapour barrier. One of the layers is metalised with high quality aluminium which reflects the infrared heat rays. The high tensile resistance is insured by the polypropylene reinforced grid between the foil layers. Product is available in three types of surface density: 90/110/150 g/m².

SURFACE DENSITY	DIMENSIONN	UV-RESISTANCE	ROLLS PER PALLET
90/110/150 g/m ²	1.5x50 m =75 m ²	60 days	40/50 rolls

■ PRODUCT CODE 12-070

PAROTEC Active

A two-layer, active vapour barrier made out of fibre and a solid PE film, which serves as active resistance against water steam. It secures the space between the gypsum cardboard plate and itself from condensation of overflow vapour. Also, if there is such a need the moisture (for instance a wet roof truss) will have a way to slowly penetrate to the inside of the building. Active vapour barriers find their use in house and industry constructions as a vapour barrier layer, securing the attic from moisture getting into the thermal insulation from the inside. Thanks to the variable Sd value it can lead away the vapour overflow in both directions. This innovative solution used in the PAROTEC Active vapour barrier helps to prevent the effects of fungus and mould which are damaging the building. It also secures the construction wood from decaying.

THERMO INSULATION SCREENS WIND BARRIERS

FOLTERM Uno ■ PRODUCT CODE 12-260

Thin-walled thermo-insulation screen made out of one layer of honeycomb-like non-flammable PE bubble wrap structure, enclosed in two layers of metalised PE foil. Such construction allows to reflect infrared heat rays. It is used both in the walls and roofs as a vapour barrier layer.

MATERIAL	THICKNESS	SURFACE DENSITY	ROLL DIMENSIONN	THERMAL RESISTANCE	FIRE RESISTANCE
PE bubble wrap PE metalised foil	3 mm	190 g/m ²	1.2 m x 12.5 = 15 m ²	≥ 0.6 m ² K/W	n/a

FOLTERM Duo ■ PRODUCT CODE 12-261

Thin-walled, thermo-insulation screen made out of PE foam, enclosed in two layers of highly reflective aluminium foil. The main feature of the thermo-insulation screen is to reflect thermal energy, infrared heat rays from its surface.

MATERIAL	THICKNESS	SURFACE DENSITY	ROLL DIMENSIONN	THERMAL RESISTANCE	FIRE RESISTANCE

FOLTERM Multi ■ PRODUCT CODE 12-262

Thin-walled thermo-insulation screen made from two layers of honeycomb-structured non-flammable PE bubble wrap, enclosed in two layers of highly effective reflecting aluminium foil, which have been polished and secured from oxidation. Folterm Multi is a infrared rays reflecting system.

MATERIAL	THICKNESS	SURFACE DENSITY	ROLL DIMENSIONN	THERMAL RESISTANCE	FIRE RESISTANCE
2 x Aluminium/ polyethylene	7 mm	330 g/m ²	1.20 m x 20 = 24 m ²	≥ 1.1 m ² K/W	YES

PAROTEC Vinto ■ PRODUCT CODE 10-077

Vapour permeable wind barrier, used in construction for water and wind insulation of walls. Used in residential and industrial buildings. The wind barrier PAROTEC Vinto is made out of UV resistant, thanks to the use of stabilising additives, polypropylene fibre. It ensures the high diffusion of vapour and reduces the air flow. PAROTEC Vinto finds its use in skeleton constructions as the insulation in ventilated elevations, log houses and siding elevations. The product does not require any ventilation gap, thus the thermal insulation (mineral wool, glass), can touch the wind barrier. The product should not be used on pitched roofs, where it is advised to use a roof membrane.

SURFACE DENSITY	DIMENSIONN	TENSILE RESISTANCE	SD-VALUE	UV RESISTANCE	WATERTIGHTNESS	PIECES PER PALLET
100 g/m ²	1.5 x 50 m = 75 m ²	>210 N/5 cm (lengthwise) >130 N/5 cm (crosswise)	0.02 m	90 days	W3	30 rolls

ROOF FOILS

initial roofing layer for pitched roofs with loft

PAROTEC 90/110

A low water permeability roof foil, for poorly ventilated or non-insulated pitched roofs. Built out of two layers of polyethylene foil and a polypropylene grid between, which insures the tensile resistance. The roof foil PAROTEC 90 has microperforations on the surface, which ensures the proper vapour permeability. Because it is UV stable it can last up to 2 months while exposed to direct sunlight, thus giving enough time for the mounting of the roof covering.

Foundation foil FK 400

New in offer! for waterproofing foundations

It is designed as insulation for vertical walls and foundations. Performs as vertical waterproofing of foundations and as a protection against mechanical damage. The way it is embossed allows for water and moisture drainage which secures the building foundation. Such embossment prevents the foil from sliding down during construction works. It finds its use during construction of patios, ceilings, floors, could be used to seal ditches and as a drainage in green roofs.

Unotec facade

The tape is designed for sealing and repairing damaged wind barriers. Small tears can be sealed with the tape itself. For larger gaps use a patch made out of an additional piece of membrane, which must be tightly taped along the edges with the Unotec facade tape.

Unotec

Used to repair damage caused during installation of roofing membranes. Small tears can be sealed with the tape itself. For larger gaps use a patch made out of an additional piece of membrane, which must be tightly taped along the edges with the Unotec tape.

Alutec

Sealing metalised vapour barrier overlaps. While sealing insulation screens, connecting strips should be done at the "seam" with the wide Alutec tape. It is also possible to make necessary repairs with the tape.

Butyltec

Thanks to the high flexibility of butyl adhesive, Butyltec offers good sealing of membranes, thermal-insulation screens and films to the rough surface of the wall. The tape must first be applied to the surface of the material and then gradually remove the backing paper pushed to the wall. The seam should be dry, free from dust and grease.

Parotec

Used to seal and protect tear places where counter battens are in the counter with the surface of the membrane. Apply the tape on the top of counter battens or directly on the membrane along the rafters, then carefully apply the battens to the rafters and fasten with nails or screws.

Izotec

It is used for sealing vapour barrier overlapping, repairing and sealing penetrations e.g. ventilation pipes through the roof slope. The sealed surface should be clean and the tape exactly pressed, without irregularities and air bubbles through which moisture can penetrate, weakening the sealed place.

Steltec

Double-sided, highly adhesive tape, for attaching the vapour barrier to the steel structures. Stick the tape to a cleaned surface of the frame, then gradually peel the backing paper sticking the vapour barrier in place.

Duotec

Double-sided strong acrylic adhesive tape, reinforced with polyester mesh, intended to bond overlapped foils and membranes. The tape must be applied along the entire length of the bottom strip, then gradually peeling the backing paper off, the upper strip of the foil must be placed on the tape. Keep in mind about pressing the sealing place. The sealing surface of the membranes should be dry and free from dust and dirt.

ADHESIVE TAPES

for roof membranes and foils

DUOTEC ■ PRODUCT CODE (dimension) length 25m - 10-112 | length 50m - 10-113

Double-sided adhesive tape for sealing overlapping of roof membranes, vapour barriers, roof foils and other building materials made out of plastic. The tape is made out of a strip of special glue on the basis of acrylic dispersion, reinforced with a polyester grid. It distinguishes itself with a very high adhesive power.

MEDIUM	ADHESIVE TYPE	TAPE LENGTH	TAPE WIDTH	USAGE TEMPERATURE	COLOUR	BULK CONTAINER

COLLAR FLASHINGS

Collar flashings are made out of high quality EPDM rubber for cable and pipe passages which are very resistant against aging processes. The cable flashing collars have an additional template covered with acrylic adhesive for easier mounting on the surfaces of membranes, roof foils, vapour barriers and planks. When using the version without the additional adhesive, it is advised to secure the collar flashing with izotec tape.

IZOTEC ■ PRODUCT CODE 12-100

Single-sided adhesive tape, reinforced with PE-fibre. Made for sealing, overlapping and repairing damage to polypropylene and polyethylene foils and bonding them with other plastics. Stands out for its very high adhesive power and resistance to UV and weather conditions.

MEDIUM	ADHESIVE TYPE	TAPE LENGTH	TAPE WIDTH	USAGE TEMPERATURE	COLOUR	BULK CONTAINER
PE foil and PE grid	Acrylic dispersion	25 m	50 mm	from +5°C	White	12 rolls

PUROTEC / PUROTEC PREMIUM

Single-sided adhesive tape used to put under the counter battens; seals the connection between the membrane and the counter battens. Made out of closed cell polyethylene foam covered with an acrylic dispersion-based adhesive. Stands out for high resistance to UV and weather conditions.

MEDIUM	ADHESIVE TYPE	TAPE LENGTH	TAPE WIDTH	USAGE TEMPERATURE	COLOUR	BULK CONTAINER
PE foam	Acrylic	30 m	40, 50 or 60 mm	from +5°C	Graphite	24 rolls

STELTEC ■ PRODUCT CODE 10-114

Single-sided adhesive tape made especially for mounting all PE-based foils (yellow vapour barriers, reinforced foils and metalised foils) to aluminium racks. Stands out for a very high, initial adhesive power for ease of use. Applied with a very thick layer of glue (200 µm), resistant against sliding of the mounted foil. STELTEC is reinforced with a polyester grid for better tensile resistance.

MEDIUM	ADHESIVE TYPE	TAPE LENGTH	TAPE WIDTH	USAGE TEMPERATURE	COLOUR	BULK CONTAINER
Polyester fibre	Synthetic india rubber	50 m	50 mm	from -10°C	Transparent	12 rolls

ALUTEC

Single-sided adhesive, smooth tape with aluminium coating, made for sealing the overlapping pieces of foil and repairing damage to aluminium foils and vapour barriers. Also used for taping and mounting ventilation, air conditioning and heating systems. Highly resistant against UV and aging processes.

MEDIUM	ADHESIVE TYPE	TAPE LENGTH	TAPE WIDTH	USAGE TEMPERATURE	COLOUR	BULK CONTAINER

AIR TIGHT ROOF THANKS TO PROFESSIONAL ROOF ACCESSORIES

AN IMPORTANT STEP IN THE FINAL CONSTRUCTION STAGE OF BUILDING THE ROOF IS FINISHING THE ROOFING WORKS, ON WHICH THE DURABILITY OF THE ROOF DEPENDS. THE RIDGE AREA, CHIMNEY, EAVES AND ROOF VALLEY ARE JUST A FEW OF THEM. DURING FINISHING OF THE RIDGE AREA, THE MOST POPULAR PRODUCTS THAT ARE BEING USED ARE DROLL AND VROLL RIDGE TAPES AND FLASHINGS WHICH ARE THE INITIAL PROTECTION AGAINST WATER, SNOW AND DUST. THE STRUCTURE AND FLEXIBILITY OF THE RIDGE TAPES AND FLASHINGS ALLOWS FOR PROPER VENTILATION.

Roofers use two methods for finishing the chimney. The first one is the manual execution of the sealing collar out of thin plate or aluminium. This is a complicated and time consuming method. A simpler alternative is to use strips of chimney flashing made from aluminium or lead, which can be easily adapted to the bonding surface of the chimney and roofing.

The roof valley zone is a particularly difficult area to work on because most leaks occur here. It can be easily secured with crosswise and lengthwise embossed roof valley flashings which are made from aluminium sheet that can be easily shaped without using tools. The last place are the eaves, of which an essential element are eaves flashings, which allow placing the membrane into the gutter.

TILE STORM CLIPS

The durability and tightness of the roof depends on the installation of tiles. Tile clips are mainly used in order to install them properly, by which it is fixed to the roof battens. For fast and easy roofing work there are available versions made of galvanised wire with suitable flexibility, which do not require any additional tools in their application. Just hook the clip in an appropriate manner on the edge of the batten and tiles lock. The type of clip, as well as its size, depends on the types of roof tiles and batten thickness. We can distinguish several variants depending on the method of their installation (for top or side tiles lock), or the type of tiles (ceramic, concrete).

Installation (see p. 30)

TERMS OF GLOSSARY

• Ridge

This is the highest part of the roof set up at the contact point of two roof slopes. Furthermore, we can distinguish side ridges which are formed from the intersection of the oblique edge of the roof. Ridges play an important role in proper ventilation of the roof structure, so it is important to protect this area in a way that allows free dissipation of moisture from the roof shell. At the same time preventing outer water and snow from entering.

• Roof valley

Unlike a ridge, it is a concave edge formed at the confluence of two roof slopes that is most exposed to weather conditions. Any errors in the flashing may directly lead to leaks and damage to the building.

• Eaves

The lowest zone along the edgeline of the roofs rafter framing. The eaves are the inlet of ventilation ducts between the roof sheathing and the membrane, as well as between the insulation and the first initial layer of low vapour permeable barrier. The eaves is also to lead water from membrane to the lower gutter.

ROOF RIDGE ROLL

Properties

vRoll ridge roll is a product of a new generation. Thanks to its high diffusion fabric it ensures adequate ventilation between the roof cover and bottom roof layers. The ridge is a very sensitive area, especially in a case of using uneven tiles like ceramic tiles. Ridge tiles crowning the ridge do not adhere to the edges of the roof tiles, so they are not able to provide sufficient tightness. Therefore, the vRoll ridge roll should be used. It will allow to discharge the water vapour permeating through the construction layers of the roof, from the attic and at the same time it provides protection against penetration of water, snow and dust.

The surface of the tape

is covered with polyester paint coating, resistant to sunlight. Additional pleated metal surface simplifies the forming and installing of the roll on the roof sheathing.

Solid finish of the product

the permeable material is combined with a metal strip with strong adhesive and specialised seam, guaranteeing a hard to tear connection.

Ventilation function

Breathable non-woven fabric used in the vRoll ridge roll and perforations on the surface of the dRoll ridge roll allows vapour to easily escape from the roof.

Butyl layer for bonding

Ridge rolls have butyl adhesive strips around the edges, which form a flexible connection, resistant to moisture and aging. Thanks to a thick layer it is possible to glue the adhesive tape to rough surfaces.

DRY VENTED ROOF RIDGE vRoll

A product of a new generation thanks to the high vapour diffusion of the used fibre, vRoll provides a proper ventilation between the roof covering and the lowest layers of the roof expanse. The ridge vent roll vRoll is made out of two strips of pleated aluminium and a vapour permeable polypropylene fibre. The underneath is covered on the brinks with buthyl adhesive strips. The fabric in the middle of the roll ensures proper air ventilation and has vapour capabilities. Also secures the ridge against the penetration of water, dust and snow.

Aluminium + vapour permeable PP-fibre	Yes	240/300/390 mm	0.14 mm	5 m	5 rolls/box 175 rolls/pallet	Butyl	100 g/m ²

NEW!

DRY VENTED ROOF RIDGE xRoll

is a new generation product with increased functional parameters. Due to the high diffusivity of the technical fabric used, it ensures proper ventilation of the space between the roofing and the bottom layers of the roof. The ridge tape xRoll consists of two strips of pleated aluminium and a vapour-permeable technical fabric with an increased weight of 220 g / m². It is characterised by high resistance to mechanical damage, UV radiation (up to 5 years) and aging processes. From the bottom side, at the edges, the aluminium is covered with butyl glue strips. Ventilation, which is the inner part of the tape, ensures the drain of steam to the outside and the free flow of air, and prevents penetration of water, dust and snow under the roof surface.

Aluminium + technical fabric	5 years	240, 320 mm	0.14 mm	220 g/m ²	5 m	Butyl	240 mm - 245 pc. 320 mm - 175 pc.

CHIMNEY FLASHING TAPES

Rollable chimney flashing strips are used to seal the spaces between the roof and the chimney or the wall - wherever the roof surface comes into contact with the wall. The tapes can be divided into groups, due to their material: lead (heavy, very flexible) and aluminium (light, less flexible) as well as the embossment of the tape: pleated 2D, 3D, (pyramid-shaped) or flat tape.

CHIMNEY ALUMINIUM FLASHING TAPE 2D

A self-adhesive tape made out of pleated aluminium, one side coated with polyester paint and the other with a buthyl adhesive. The tape is used for flashing around the chimneys, walls, bay windows and roof windows. The product is resistant to long term influence of weather conditions like UV rays, frost, rain, moisture and aging processes.

NOVELTY!

ROOFING TAPES

for sealing work

BITAPE - bituminous tape

is a self-vulcanising tape made of flexible bituminous mass and aluminium tape. It has excellent adhesion to most building materials such as metal, wood, ceramics, concrete, stone, plastic and some types of PVC. It is resistant to water, humidity, atmospheric influences and UV radiation. It allows immediate sealing of roofing treatments, masts, antennas and roof hatchways.

ABOVE GUTTER EAVES FLASHING STRIP

We offer a variety of products to facilitate the implementation of the eaves in accordance with the newest roofing technology. The eaves flashings are designed to direct the water from the membrane and the covering to the gutter.

○ Eaves comb / crest with a ventilation grid

provides air intake under the roof surface and prevents birds entering the area between the tiles.

○ Eaves ventilation grid roll

To protect existing ventilation gaps, you can use ventilation grid which is attached directly to the batten with staples.

○ Eaves strip

should be attached to the eaves plank using roofing paper nails with a big round head. Put the profiled edge into the gutter. Stick the membrane or foil to the eaves strip ensuring adequate material stretch.

ABOVE GUTTER EAVES FLASHING STRIP

The strip is made out of a 0.58 mm-thick aluminium sheet covered with polyester-based paint, secured with a layer of polyethylene foil which should be removed before mounting.

ROOF VALLEY FLASHING

Roof valley flashings are extremely important components of the roof. They provide a seal at the connection of slopes and at the same time protect the gutter. Made from custom pressed sheets, they are a part of the roof valley system (flashings, seals and installation clips). The new roof valley flashings are designed for quick installation - not only have they less connections in the line of the roof valley, but they are quick. Roof valley flashings are characterised by quick durability, flexibility and long-term resistance to large amounts of rainfall.

Profiling

of the roof valley flashing allows it to be bent adequately to the roof's structure, without the use of additional tools.

Installation clips

allow a stable installation of the roof valley flashing to the roofs structure. The assembly is fast and intuitive.

Roof valley flashing wedge gasket

are used at the edges of the roof valley flashing to secure the space under the tiles against snow or rain blown into the roof slope.

CROSSWISE ROOF VALLEY FLASHING

A roof valley flashing made out of a 0.58 mm-thick aluminium sheet covered with polyester-based paint, secured with a layer of polyethylene foil which should be removed before installing. The profiling (bending) points are well marked on the product. The way this flashing is shaped simplifies the profiling and bending by hand while working on the roof. The crosswise embossing strengthens the construction and secures the roof from overflowing water.

COMPRESSIBLE TAPE

Self-adhesive, elastic PU foam tape covered with modified acrylic suspension with a density of 50kg/m³. The tape expands to 80-90% of its goal-height. After 24 hours it should reach its full length of even 5 times its initial height. Perfectly filling up and sealing of all gaps and securing them from weather factors, enabling vapour diffusion at the same time.

Roof tile clip Nord Braas/Euronit

Tin head of the clip should be hooked on the side lock of tiles as shown in the picture, and then the tip of the clip should be nailed into the batten.

Clip for cut tile pieces

The clip is used to most of the cut tiles. The clips clamp should be wedged onto the edge of the tile, and then the tip of the wire should be attached to the batten with a nail with a wide head.

Clip type "U"

with the characteristic shape of the letter "u" allows to attach concrete roof tiles permanently to the batten. Hook one end of the clip to the upper lock of the tile, drive the second one into the batten.

Clip type „R“

designed for fastening ceramic tiles in pairs. The wire should be put under the batten and then hook the bent tip to the bottom and upper tiles side locks.

Roof tile side clip type Uni, Roben, Creaton, Koramic

Hook the clip to the side lock of the ceramic tile and then gently tap it into the batten. Clip is used to fasten only the upper tiles, as shown in the photograph.

Clip type "J416"

Put the clip under the batten, hooks one end to the upper lock of the tile and then the other to the side lock, keeping in mind to attach the clips on the correct side.

Clip type "J"

The wider end of the clip hooks to the batten as shown in the photograph and then the other to the tile side lock. Remember to choose the appropriate clip width to the thickness of the batten.

OTHER ACCESSORIES

ALUMINIUM SHEETS

The perfect material for DIY roof flashings; the sheets are coated with polyester paint. Secured with a layer of polyethylen foil which should be removed before mounting.

MATERIAL	COATING	COATING THICKNESS	DIMENSIONNS	THICKNESS
 Aluminium sheet	 Polyester	 25 µm	 1000x2000 mm	 0.58 mm

■ PRODUCT CODE (colour)

dark-brown	06-105

CLEATS FOR METAL COVERINGS MOUNTED WITH THE STANDING SEAM METHOD

Enables fast mounting without the need to perforate the sheets. Fixed cleats prevent the lengthwise sliding of the sheet.

Expansion cleats enable a slight movement of the sheet, when the roof changes its strain, eliminating the tensions in the sheet covering.

It prevents the deforming of the roof covering, which can lead to leaks or even wrenching away of the sheet.

HOW TO SAFELY MOVE ON PITCHED ROOFS

IT OFTEN HAPPENS THAT THERE IS A NEED TO ENTER THE ROOF FOR MAINTENANCE OF EQUIPMENT SUCH AS EXHAUST CHIMNEYS, ROOF VENTS, SOLAR PANELS AND ROOF WINDOWS. THE ROLE OF ROOF WALKWAYS IS TO PROVIDE A SAFE MOVING AND WORK ENVIROMENT ON THE PITCHED ROOF WITH SHARP SLOPE ANGLE.

Besides of safety, a well thought out communication system can prevent unnecessary damage to the roof, resulting from direct walking on tiles or use of scaffolding that is unsuitable for this purpose.

The roof bridges are used for communication across the roof fall. Depending on the kind of roof cover, an appropriate support grip must be selected, suitable for a particular rafter framing design. It is installed directly to the battens or rafters by galvanised wood screws with a minimum size 8x60 mm. The set consists two or more support grips, chimney sweep bench fasteners and one chimney bench in available sizes. While using the long chimney bench, support grips must be installed at intervals not exceeding 80 cm.

The chimney sweep safety step system complements the chimney bridges. Their purpose is to create routes running along the roof slope. Chimney steps should be arranged alternately, in a way that gives the ability to walk on the roof roof as on stairs.

SETS CHARACTERISTICS

- **Easy mounting**

The various types of supports, built especially for specified roof coverings, enable a quick and effortless mounting.

- **Anti-skid surface**

The specially profiled anti-skid embossments on the whole surface of the bench increase the safety while walking on the roof.

- **Tilt angle regulation**

The form of the bench fastener "cradle" enables a free regulation of the bench's tilt angle to the roof's angle.

CRUCIAL PICTOGRAMS

TERMS GLOSSARY

- **Hot zinc covering**

The hot zinc process is made by immersing the prefabricate in heated up to liquid zinc, for several minutes. Contrary to the galvanisation process, the zinc coating is thicker and so more resistant against oxidation processes.

- **Powder varnish**

The process of securing the prefabricates is performed by covering its surface with electrified particles of paint and heating it in an oven afterwards. When heated, the particles of paint become fused and then polymerise, thus building a layer that is resistant against mechanical damage, chemicals, corrosion and high temperature.

- **RAL colours**

The palette of colours used specifically in the industry and commerce, for the unified description of a colour in the form of a four-digit number.

COMPLETE SET OF CHIMNEY BENCH

Chimney bench

Acts as a platform for moving around on a roof slope. The bench is attached with screws to the fastenings through the side slots. Separate sections of the benches are joined with fasteners through the same side slots.

Fastener

Otherwise known as a cradle. Half-round element used to connect the chimney bench with the bracket. Its shape allows you to freely adjust the angle of the platform.

Brackets

They come in different variants and sizes adapted to selected types of roofing materials. With their assistance, the entire communication set is permanently attached to the roof structure. The set consists of two brackets.

Mounting screws

Each element should be tightened with screws attached to the set.

Wood pin

TORX 6 x 50 mm are used for fixing brackets to the wooden roof structure.

Chimney sweep safety bench + fastener (cradle)

Made out of steel coated with zinc and a high quality powder coating. Equipped with anti-skid embossments. Mounted with the help of a fastener to a support grip intended for the specific roof covering type (see next page for reference)

SUPPORT TYPE BP for roof panel tiles

Support type BP is made for roof panel tiles. It has a different embossing relative to the traditional BD bracket. Suitable for sprinkled panels and Polish „Janosik” imitating wooden shingles. The length of the module is 370 cm, the height of the crease is 25 cm.

PRODUCT CODE (colour)

A COMPLETE CHIMNEY TABLE IS MADE UP OF:

chimney sweep safety step

the right type of bracket
(selected for roofing tiles)

supports for mounting chimney sweep safety step

DBDC - concrete and ceramic tiles and scale tiles/beavertail tiles

BD - for metal tile

U - for flat covering

NEW!

CHIMNEY SAFETY SWEEP STEP WITH DOUBLE SUPPORT TECTO

for vertical movement on the roof slope

It is made of steel sheet subjected to a hot-zinc galvanising process and painting powder. The complete step consists of a platform and two brackets. Degrees should be installed at intervals of 40-50 cm depending on the roof pitch.

MATERIAL	PRESERVATION	COATING	WIDTH	THICKNESS
 Steel	 Hot zinc	 Powder varnish	 30 mm	 4 mm

COMPLETE CHIMNEY SAFETY SWEEP STEPS CONSIST OF :

platform TECTO

two supports TECTO

● **NON-SLIP SURFACE**

The step has been provided with non-slip ribbing and a special indentation acting as a handle to help you navigate between levels.

● **UNIVERSAL APPLICATION**

The LN bracket allows free assembly of the set on most roofs with a roofing made of concrete, ceramic, carp or slate tiles.

● **ADJUSTMENT OF ELEMENT SETTINGS**

The set gives the possibility of adjusting the angle of inclination of the step in the range of 15 - 50° and the width of the spacing of supports 110 - 190 mm, which simplifies their adjustment to the roofing system.

ADVANTAGES OF USING SNOW PROTECTION

BESIDES ROOF WALKWAYS, AN IMPORTANT ELEMENT OF THE ROOF IS ITS SNOW PROTECTION. A TYPICAL SYSTEM CONSISTS OF A SNOW FENCE WITH TWO SUPPORT BRACKETS, WHICH SECURES IT TO THE ROOF CONSTRUCTION.

Thanks to the use of snow fences and snow guards we secure our gutter system against severe damage caused by the weight of snow slipping down from the roof. The second but no less important cause for using snow protection is the falling of big, frozen chunks of snow from the roof, which can cause a threat to people and property under the roof's eaves.

The mounting of the elements is done similar to that of roof walkways, directly to the roof's construction, rafters or battens. The snow fence support roaches, such as the safety bench supports, are built for specific roof coverings, and their ordination is analogical.

HOW MANY GRIPS DO I NEED?

WHILE MOUNTING A SNOW FENCE YOU SHOULD FIRST CONSIDER THE LENGTH OF THE SNOW FENCE AND THE PITCH ANGLE OF THE ROOF.

What does the number of the snow fence grips depend on? From the pitch angle of the roof (the greater the angle, the greater the number of grips), from the length of the roof plain (rafter length) . above 6m it is required to use more grips, or even mount a second line of snow fences. By standard rafter lengths, you should use a number of rafters in accordance with the table below.

ROOF PITCH ANGLE	to 20°	20° to 40°	above 40°
• 150 cm-long snow fence	2 grips	3 grips	4 grips
• 200 cm-long snow fence	3 grips	4 grips	5 grips
• 300 cm-long snow fence	4 grips	5 grips	6 grips

TERMS OF GLOSSARY

• Hot zinc covering

The hot zinc process is made by immersing the prefabricate, in heated liquid zinc for several minutes. Contrary to the galvanisation process the zinc coating is thicker and much more resistant against oxidation processes.

• Powder varnish

The process of securing the prefabricates, by covering its surface with electrified particles of paint, and heating it in an oven afterwards. During heating process the particles of paint become fused and then polymerise, thus building a layer that's resistant against mechanical damage, chemicals, corrosion and high temperature.

• RAL colours

The palette of colours used specifically in the industry and commerce, for the unified description of a colour in the form of a four digit number.

COMPLETE SNOW PROTECTION

for horizontal roof protection

Snow fence

The fence is made out of hot-dipped galvanised zinc and powder coated steel. Together with the support designed for the given roof covering, it builds a very efficient protection against snow sliding from the roof. Made out of angle bars 20x20x2 mm (fence skeleton) and a 1mm-thick metal sheet (crossbeams). Available in two widths: 150 and 200 mm.

GRIPS FOR METAL SHEET TILES

They are made of steel sheet subjected to the process of hot zinc galvanising and powder painting. They are used for mounting a snow fence on pitched roofs. Each model is adapted to a specific type of roofing. The grips are attached directly to the roof truss structure. The BP grip is designed for panel type roof tiles; it has a different embossing in relation to the traditional BD grips. Fits the panels with sprinkles and „Janosik“-imitating wooden shingles. The length of the module is 370 cm. the height of the crease 25 cm. The list of BD brackets for the roof panel can be found in the table opposite.

GRIP FOR WOODEN PIPES

for linear roof protection

They are made of steel sheet subjected to the process of hot zinc galvanising and powder painting. They are used similarly to a snow fence or pipes to protect snow layers on pitched roofs. The LN grip is designed for most roofs covered with concrete or ceramic tiles. Available in RAL colours and zinc.

PIPE SNOW PROTECTION SYSTEM

for horizontal roof protection

Snow protection pipe

The pipe is made out of hot-dipped galvanised zinc and powder coated steel. Together with the support designed for the given roof covering, builds a very efficient protection against snow sliding from the roof. Available length: 150 and 200 cm.

Effective roof ventilation

While roof vents all perform similarly, their effectiveness may vary depending on the roof. Ventilation provides fresh air to your home and helps take the old, stale air out. It allows your home to “breathe.” Good attic ventilation protects your home from damage by eliminating excess moisture. However, homes come in all different shapes and sizes, so it’s important to know which ventilation system will be adequate. Keep the roof’s pitch in mind when deciding as well. Lack of proper roof ventilation can cause many roofing problems for homeowners, such as decreasing the life of your roof and its decking, increasing the risk of condensation that causes mould and mildew and much more.

Other products

Roof expanse vents

meant for ventilating and removal of moisture from uninhabited attics, roofs construction and insulation.

Aerial passthroughs

enabling a tight upright passage of masts, cables etc. through the roof plane.

Solar passthroughs

enabling a tight passage of small diameter pipes and cables for connecting devices such as solar collectors or photovoltaic modules.

Roof vent accessories

flexible connection tubes or a range of pipe reductions ease the connection of a roof vent to the ventilation line.

WiroVent PLUS

Roof vents

The WiroVent Plus system is an improved version of the basic WiroVent model, enriched with a condensate drain function. The diameter of the roof vent is DN 125. It comes in a non-insulated/insulated version as well as a version with a mechanical ventilator. The high-quality butyl seal permanently fills the joints when mounting the plate base. The palette of colours for the ventilator allows for an aesthetic fitting to the roofing materials. The special ring design ensures effective ventilation, even at the minimum wind speed. The roof vent is designed for roofs with a slope from 5° - 40°.

AVAILABLE COLOURS

ROOF PASSAGE FOR ROOF VENTS

An integral part of the roof vent is a passage/crossing that should be adapted to the type of roofing on which it is to be fixed. Passages/crossings are adapted to bituminous, flat, roofing, ceramic and concrete tiles. A full list of crossings to roofing tiles and other tiles is available in a separate table.

COMPLEMENTARY ACCESSORIES FOR ROOF VENTS

RUROFLEX PLUS - connecting pipe with reduction or ventilation grille

It is used for connecting roof vents of the WiroVent Pro and WiroVent Plus series with ventilation ducts. The product is characterised by high flexibility and is used to connect WiroVent roof vents with ventilation or sewage ducts. Produced in black RAL 9005.

PIPE FOR CONNECTING A CONDENSER to roof vents WiroVent Plus

Condenser connection pipe - It is used to connect the condenser to ventilation roof vents WiroVent Plus with the diameter DN 125. The product has a clamping nut that allows for quick assembly and ensures permanent installation of the connected elements.

WATER CONDENSER

The task is to capture and remove rest of the condensate formed in conditions of high humidity. It allows redirection of excessive condensate to the remainder of the condensate in which the evaporation process takes place. With high condensate it is possible to connect the tube included in the kit, allowing it to be drained outside. Engineering construction matched to the WiroVent and WiroVent Plus system ensures quick and trouble-free installation of the product. The product is resistant to atmospheric conditions, UV radiation and the aging process.

SEALING SET

The WiroVent sealing set, which is mounted in the place of passage of the ventilation chimney through the roof foil, protects against penetration of water or condensate. Available only in black RAL 9005. Passages are used in the WiroVent system where the passage through the roofing foil of the roof vent is vertical in relation to the roof slope.

WiroVent

Roof vents

The WireVent system are ventilation tiles which have adjustable slope angle available in 2 diameters: DN 110 mm and DN 150 mm. They are available in insulated and non-insulated versions, which prevents the condensation of water vapour in the ventilation duct as well as in the mechanical fan. There is also a turbo roof vent available with rotating base which supports the ventilation flow. A high-quality butyl seal permanently fills the connection when mounting the base to the plate. The colour palette of the ventilator allows for an aesthetic adjustment to the roofing materials. A special ring-structure construction ensures effective ventilation even by the minimal wind speed. Slope angle to roof vents with the diameter DN 110 is from 5 to 45 degrees, and for the roof vents with DN 150 the regulation is possible in the scope between 15 and 45 degrees.

ADDITIONAL ACCESSORIES

CONNECTING PIPE

The product is characterised by high flexibility and is used to connect roof vents from the WiroVent series with ventilation or sewage ducts. The tube is available in black (RAL 9005).

MATERIAL

PP, PVC

DIAMETER

DN 110
DN 150

LENGTH

420 mm
600 mm

SEALING SET

The WiroVent sealing set, which is mounted in the place of passage of the ventilation chimney through the roof foil, protects against penetration of water or condensate. Available only in black RAL 9005. Passages are used in the WiroVent system where the passage through the roofing foil of the roof vent is vertical in relation to the roof slope.

Additional assortment

In addition to roof vents, a wide range of products supplementing the ventilation system is available. For instance expanse vents for unused attics, chimney caps, useful aerial passthroughs for antenna masts or sun collector pipes. Passages and vents are adapted for bituminous, flat roofing, roofing tiles, ceramic and concrete tiles. A full list of passages to roofing tiles and other tiles is available in a separate table.

ROOF EXPANSE VENT

Made for ventilating and removal of moisture from attics, the roof envelope and insulation. It decreases the temperature of attics in the summer.

MATERIAL	DIAMETER	HEIGHT
		
Polypropylene	DN 150	80 mm

concrete tile or ceramic

metal tile

universal passage to roof tiles metal tile

non-existent bituminous covers

bituminous roofing flat sheet

AERIAL PASSTHROUGH

Used for putting aerials and cables through the roof plane. The socket enables the adjustment of the hole to the mast's diameter from 19 to 90 mm.

MATERIAL	DIAMETER	TILT ANGLE REGULATION
		
Polypropylene	DN 19, 25, 38, 50, 60, 75 or 90	5-45°

concrete tile or ceramic

metal tile

universal passage to roof tiles metal tile

non-existent bituminous covers

bituminous roofing flat sheet

SOLAR PASSTHROUGH

Used for putting solar tubings through the roof plane. The product is suitable for single and double tubings.

MATERIAL

Polypropylene

concrete tile or ceramic

metal tile

universal passage to roof tiles metal tile

non-existent bituminous covers

bituminous roofing flat sheet

SEWAGE VENT

A complete sewer vent with a profiled roof passage. It is used for venting sewage systems.

Polypropylene

concrete tile or ceramic

metal tile

universal passage to roof tiles metal tile

non-existent bituminous covers

bituminous roofing flat sheet

CHIMNEY CAP ALFAWENT

The caps are suitable for one- or multi-row chimneys with gravitational ventilation lines. The caps can be mounted on the chimney itself or directly on the ventilation line. The ring construction of the cap enables an effective draught in the chimney.

MATERIAL	DIAMETER	HEIGHT	AVAILABLE COLOURS
 Polypropylene	 DN 150	 410 mm	RAL 8017 brown RAL 7024 graphite

PLANE PP ROOF VENTS AND GRAVITATIONAL VENTS

A whole range of well-designed roof vents that enable the use of wind to increase the circulation. Mounted on the endings of vent and sewage systems. The given diameter is the inside Dimensionn meant for mounting on the bare-end of a pipe.

MATERIAL	ROOF VENT DIAMETER	ROOF VENT HEIGHT	GRAVITATIONAL VENT DIAMETER	GRAVITATIONAL VENT HEIGHT	AVAILABLE COLOURS
 Polypropylene	 DN 50, 75 or 110	 143, 249, 303, 356 mm	 DN 50, 75, 110, 160, 200	 187, 203, 306, 338, 420 mm	RAL 8017 brown RAL 7046 grey

ROOF VENTS FOR SAUDABLE ROOFING PAPER

Roof vents made for airing of thermo-insulation and leading away of water vapour that accumulates under an airtight roof covering. A removable cap simplifies the mounting. The rosette, which is part of the set, secures the vent from penetrating rain and gives the vent an aesthetic look.

MATERIAL	DIAMETER	HEIGHT	AVAILABLE COLOURS
 Polypropylene	 DN 75, 110	 275, 355 mm	RAL 9005 black

FLANGE TYPE FLASHINGS

Flashing flanges made out of high-quality EPDM rubber for cable and pipe passages which are very resistant against the ageing processes. The cable flanges have an additional template covered with acrylic adhesive for easier mounting on the surfaces of membranes, roof foils, vapour barriers and planking. When using the version of flanges without the additional adhesive, it is advised to secure the flange with izotec tape.

MATERIAL	PIPE SIZE	CABLE SIZE
 india-rubber acryl	 15-30/50-90/95-120/120-170/170-220 mm	 1x2/1x9/2x2/3x2 mm

ACCESSORIES

The flat bases are ventilation roof bases which can be connected with any vent of diameters Ø75 or Ø110. Enables an easy and tight mounting on bitumen covered flat and gable roofs.

The connection tube is a flexible pipe for connecting roof vents with the ventilation pipes.

The pipe reduction necessary among others for connecting the different diameter roof vents. There is no way to connect the reduction directly to the vent. The product is only compatible with the producer's connection tubes. Available diameters (vent diameter/pipe diameter): 110/110 mm, 110/100 mm, 150/160 mm, 150/110 mm.

BUTYL ASSORTMENT

BUTYL-BASED ADHESIVE SYSTEMS

BUTYL PULP

BUTYL CHARACTERISTICS

Butyl pulp is very resistant to aging processes, it is much desired in many industry branches. It does not expose to corrosion or mould and does not contain any solvents. The seals are tightened almost instantly and the adhesive keeps its stickiness and elasticity, does not harden or change its volume like bitumen pulps, which in time crumble and unseal the connection. Butyl adhesives do not require the use of additional tools or activating chemicals. Butyl can be used on a variety of materials with different porosity, without the need to use additional primers or other adhesives. Thanks to its constant elasticity, butyl adhesive performs well as vibration absorber or noise reductor in, for example, drivers' cabins.

Butyl-based tapes find their use in many branches of the industry e.g. roofing, construction and motorisation. Butyl's flexibility, adhesive strength and resistance to weather conditions is the most popular solution for sealing, used in the building construction sector for binding roofing foils and membranes, tightening roof and wall windows, the production of chimney flashings, expansion joints and as a sealant for sewer pipes, electrical instalations and repair of cracks.

The raw material butyl pulp is formed with industry presses until it takes the desired form of e.g. butyl tapes, of various widths brought to a carrier material (aluminium, polypropylene, fibre), profiled tapes, butyl cords with a round intersection, or felt mats with the application of adhesive. Butyl can also be used without a carrier material as a runny sealing pulp.

BUTYL PRODUCTS

The newest trends in the building industry and high demand have caused us to expand our offer of tapes, bands and cords made out of highest quality butyl. We are capable of supplying products to fulfil individual orders.

● Fibre-based sealing tapes

Self-adhesive butyl-based tape covered with special technical fibre intended to make elastic sealings in places with higher strains and/or higher moisture.

● Roofing tapes

300 mm-wide bands, adhesive on one side due to a mix of synthetic india rubber. The bands are applied onto aluminium or lead bands in a variety of RAL colours and rolled into disks.

● Butyl bands

300 mm-wide bands, adhesive on both sides due to a mix of adhesive-based synthetic india rubber. The bands are applied onto foil or silicone based paper and rolled into disks.

● Butyl cords*

A butyl cord is a band of a cube-shaped gauge, or in U, L profiles or others if needed. Highest quality synthetic india rubber mix and fullants. The cords are applied onto foil or silicone-based paper and rolled into disks.

Purpose: Sealing of joints in the building construction branch - tightening joints of ventilation and air conditioning ducts - sealing all connections which are exposed to weather conditions (e.g. roof or steel constructions). - window production - tightening of profiles.

*Product available on special order.

VELUX®

Roof windows

To our clients we offer only the leading brands of roof windows, loft ladders and window accessories that meet the highest standards of the industry, either for pitched roofs or flat roofs. We ensure a very efficient logistics system. Thanks to our high stock volume, we can guarantee a quick completion of your order. Our customer service consultants will give you all the required information about our products and advise on the most suitable solution. All information about the terms of cooperation can be found in a separate price list that will be sent to you via e-mail at your request.

Save energy

Energy renovation and future buildings are part of the solution to the world's climate and energy challenges.

With the Paris Agreement, adopted by 195 countries at the COP21 conference in Paris in December 2015, the world committed itself to containing climate change. As buildings account for almost 40% of energy used and 37% of carbon emissions in Europe, a greater focus on energy savings in buildings could play a pivotal role in reducing the impact of modern living. Thus, the time is right for a paradigm shift in the way we design and organise the buildings we live, work and play in.

„Energy efficiency in buildings represents a huge, untapped potential, not only in terms of using the world's resources in a smarter way, but also in terms of boosting economic activity, growth and jobs.“

of today's buildings
will still be in use
in 2050

75%

of existing buildings
are not energy
efficient

40%

of Europe's energy is
used in buildings

„Another major benefit of smarter energy use in buildings is the opportunity to reshape the buildings we spend almost 90% of our time in, so that they nourish our health and well-being“

Jørgen Tang-Jensen, CEO, the VELUX Group
